The book Honey Analysis has 15 chapters divided into two sections: one section that is dedicated to the analysis of bio physicochemical, and microbiological compounds and another that addresses techniques for the detection of residues and metals. We have been able to compile a book with chapters

authors from nine countries (Brazil, Chile, Italy, Malta, New Zealand, Poland, Romania, Serbia, and Turkey) and at least three continents (South America, Europe, and Oceania). The topics discussed here are physical-chemical analysis of honey, new methods for amino acid analysis, chemical residues, heavy metals, phenolic content and bioactive components, microbiological analysis, antimicrobial activity, and honey as functional food. Also there are notions of trade and characterization of honey in these countries, presenting the reality of the local market of these countries and their perspectives so that we can know more about the technique as well as the importance of this activity for each country. This may facilitate the use of innovative techniques that may ensure increased competitiveness and the world honey trade.

Metabolic Neurosciences, Volume 1: Gene Probes is a compendium of 10 papers that deals with the developments in molecular biology, biology, and electrophysiology. Section I deals with gene expression using the *Xenopus* Oocyte system for expression and cloning of neuroreceptors and channels. One paper presents a method in studying the molecules in the brain related to neurotransmitter receptors and to the voltage channels in the brain by "transplanting" functional neurotransmitter receptors into the membrane of frog oocytes. Section II describes in situ hybridization and the continuation of in situ hybridization with immunohistochemistry. One paper discusses the benefits of using alkaline phosphatase-Dig-dUTP-labeled oligonucleotide probes in high-resolution in situ in terms of performance, safety, and fast detection rendering. Section III addresses the screening, sequencing, and cloning, the procedure

which includes the rapid identification of DNA clones. One part outlines the methods and materials that are used in such identification. Section IV explains lineage analysis and Section V discusses molecular pathology, including the molecular pathology of Alzheimer's disease. This collection can prove useful for geneticists, molecular scientists, and academicians involved in neuroscience and pharmacological sciences, as well as researchers in geriatrics. By helping students directly characterize the

solutions for many minimization problems, the text serves as a prelude to the field theory for sufficiency, laying as it does the groundwork for further explorations in mathematics, physics, mechanical and electrical engineering, as well as computer science. It includes methods for the enumeration of indicator microorganisms of general contamination, indicators of hygiene and sanitary conditions, sporeforming, spoilage fungi and pathogenic bacteria. Every chapter begins with a comprehensive, in-depth and updated bibliographic reference to the microorganism(s) dealt with in that particular section of the book. The latest facts on the taxonomic position of each genus or species are given, as well as clear guidelines on how to deal with changes in nomenclature on the internet. All chapters provide schematic comparisons between the methods presented, highlighting the main differences and similarities. This allows the user to choose the method that best meets his/her needs. Moreover, each chapter lists validated alternative quick methods.

which, though not described in the book, may and can be used for the analysis of the microorganism(s) dealt with in that particular chapter. The didactic setup and the visualization of procedures and step-by-step schemes allow the user to quickly perceive and execute the procedure intended. Support material such as drawings, procedure schemes and laboratory sheets are available for downloading and customization.
