Summer farms occur throughout the world where there are rich pastures that can only be utilised for part of the year, mainly because they are under snow and ice during the winter. In Europe transhumance is often a major event when the cattle and other livestock leave their home villages and move up into the mountains, and likewise on their return. The best known sites in Europe are perhaps those found in the Alpine areas, but they occur everywhere where there are suitable highland areas to exploit. Traditionally they have been the subject of the studies of ethnographers and anthropologists, especially in the second half of the 20th century when technological and economic changes led to the gradual abandonment of the farms and to other ways of exploiting the highlands. The last of these farmers are gradually disappearing and with them the oral records and memories. Now it is archaeologists who are leading the recording of this material and also looking at the history of such farming from prehistory and from the Bronze Age with the rise in importance of 'Secondary Products' such as cheese which could be stored for use over winter. Much of the evidence can only be gathered by surface survey and by excavation, though in some cases there are good written sources which have yet to be fully exploited. This volume provides case studies, as well as brief summaries of other projects in Europe, extending from the Black Sea in the east to northern Spain and Iceland in the west, though with a concentration on the Alpine area. One thing that emerges is the very varied nature of these sites in terms of their chronology, who went to the farms, the distances travelled, and the other activities associated with transhumance such as mining. In some cases the products were primarily for the subsistence of the agricultural population, but in other cases they were traded and could produce a large amount of profit. This is the first overview of these sites in Europe written from an archaeological point of view. Fueled by media reports of gender bias in the schools, the debate over single sex education has been recently renewed. "Voices of Hope" asks for a reconsideration of the framing of that debate. For whom is single sex education better? For the attainment of which goals? What do girls gain by being schooled with male peers? What is lost? In this longitudinal study of more than fifty high school girls at four New England independent schools, Carole B. Shmurak follows their development from ninth grade through the first year of college. Case studies capture the girls' own voices as they describe their hopes for their futures and the events that subsequently affect those futures. Getting Started. Using UNIX Tools. Pucker or Puckering is the most used (abused?) term in the garment manufacturing industry. Pick up any quality controllers report, and the first thing that will strike your eye will be "...Puckering in armhole, ...Puckering in neckline binding, ...control Puckering in bottom hem..." the list is endless. Buying office quality controllers are as enamoured of this term as much as manufacturers abhor it. What is it that makes it so distasteful? Why does it occur? How can it be controlled? While there are numerous leaflets, documents and articles available on pucker, we have found that the majority of them lay great stress on "inherent pucker" (only material parameters). In this booklet have tried to include process parameters as well as sewing of lightweight fabrics. All said and done, the problem is so intricately interdependent that exhaustive compilation is well nigh impossible. We are sure this booklet will help manufacturers to understand the rationale behind this publication and we will consider our effort successful if enthusiastic readers regularly inform us about newer methods to tackle the problem.
